SUMMARY

Full-stack developer and co-founder of Iano, a two-person software studio in Nairobi, with production multi-tenant SaaS, ERP, restaurant POS, and three-sided logistics platforms now running in live venues. I own architecture end to end, from strict-TypeScript monorepo back ends with RBAC, tenant isolation, real-time sync, and audit logging, to fast, high-scoring front ends. Most recently I shipped full-stack features inside an established 13-person team, working from specs with code reviewed by the company's CTO.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, SQL, Kotlin, Python, C++, Java, HTML5, CSS3

Front-End: React, Next.js (App Router, RSC, Server Actions), React Native (Expo), Tailwind CSS, shadcn/ui, Radix, Framer Motion, Zustand, react-hook-form, Zod

Back-End: Node.js, Express, NestJS, REST API design, Socket.IO / WebSockets, BullMQ, Auth.js

Databases: PostgreSQL, MongoDB, Redis, Prisma, Drizzle ORM, relational and document modeling

Architecture: Multi-tenant SaaS, Turborepo / pnpm monorepos, pluggable module systems, offline-first sync, RBAC, audit logging, domain-driven design

Cloud, DevOps & Tooling: Docker, Caddy, Nginx, PM2, Cloudflare, DigitalOcean, Netlify, AWS Cloud Foundations, GitHub Actions CI/CD, Vitest, Playwright, MinIO / S3, Linux (Arch)

Integrations: M-Pesa (Daraja), Shopify Storefront API, HubSpot, SendGrid, Google Maps, Cloudinary

EXPERIENCE

Co-Founder & Full-Stack Developer - Iano, Nairobi 2020 - Present

- Co-founded a two-person software studio and engineer production web, mobile, and SaaS products end to end, across both client work and in-house products now running in live venues.
- Ship multi-tenant SaaS platforms (ERP, restaurant POS, delivery logistics) on strict-TypeScript monorepos with RBAC, tenant isolation, audit logging, and fully self-hostable deploy stacks.
- Own architecture across the stack: pluggable module systems, real-time WebSocket data flows, M-Pesa payment integration, and CI/CD pipelines.

Software Engineering Intern, Full-Stack - CodexSafari Jan 2026 - Mar 2026

- Built front-end and back-end features for CodexPOS, a SaaS-first multi-tenant point-of-sale platform (NestJS and React monorepo), within clearly defined domain boundaries.
- Worked from tickets and specs alongside a 12-person team, delivering features through pull-request review and async handoff, with my work reviewed directly by the company's CEO/CTO.
- Implemented role-based access control and multi-tenant data isolation so distinct retail organizations and permission levels operate securely on one platform.
- Engineered subscription gating to enable and restrict features by tenant tier, supporting the product's SaaS monetization model.

SELECTED PROJECTS

Esto - Multi-Tenant Restaurant POS & Platform

esto.solutions

Next.js · TypeScript · Kotlin (Android) · Cloudflare · Docker

Live in 5 restaurants · v1.0.1 across 219+ commits · 91/100 Lighthouse performance

- Built and maintain a multi-tenant restaurant operating system spanning POS, inventory, analytics, and shift handling, plus a native Kotlin Android client with a cloud-mode printing pipeline.
- Diagnosed and fixed a production shift-close failure from a written investigation, shipping v1.0.1; hardened the POS with configurable tax, multi-currency, and atomic concurrency handling to make it production-safe.
- Implemented subdomain-to-path multi-tenancy at the Cloudflare edge and JSON-config-driven branding, so new venues onboard by configuration, not code forks; multi-language (English / Arabic) and multi-currency.

Amana - Three-Sided Delivery Logistics Platform

amana.ke

Express · Socket.IO · MongoDB · Redis · Next.js · React Native (Expo) · M-Pesa

Live with its first venue (serving ~150+ customers/day) · 98/100 Lighthouse performance

- Delivered a three-sided logistics platform (restaurants, riders, customers) as a single Turborepo monorepo: an Express REST plus WebSocket API, a Next.js admin dashboard, and a React Native (Expo) rider app sharing validation and config packages.
- Powered real-time, role-aware order and rider tracking over Socket.IO, M-Pesa (Daraja) STK-push payments, and JWT access / refresh auth with OTP verification.
- Built the native rider app for reliable background location, notifications, and on-the-road performance, with a full deploy story across PM2 / Nginx, Docker, and EAS builds.

MERX - Multi-Tenant Self-Hosted ERP Platform

merx.systems

Next.js 15 · TypeScript · Turborepo · PostgreSQL · Drizzle · Redis / BullMQ · Docker · Caddy

Final pre-production · live demo login on the sign-in page · 92/100 Lighthouse performance

- Architected a self-hosted, multi-tenant ERP as a Turborepo monorepo with three first-party modules (Accounting, Inventory, Supply) on a pluggable registry. New modules self-register nav, routes, permissions, and PDF templates at boot without touching the core.
- Guaranteed tenant isolation with a request-scoped AsyncLocalStorage TenantContext and mandatory org-scoping on every query, enforced at the core layer rather than left to per-query discipline; permission-string RBAC and audit logging built in.
- Shipped a keyed React-PDF document engine with a Puppeteer fallback, shared across modules, on a fully self-hostable stack (Docker plus Caddy auto-HTTPS), covered by Vitest and Playwright.

Octavia Carbon - Climate-Tech Marketing + Commerce Site

octaviacarbon.com

Next.js 14 · Tailwind · Framer Motion · Shopify Storefront API · HubSpot · SendGrid

Shipped and handed off to client · 91/100 Lighthouse performance at handoff

- Built a production marketing-plus-commerce site for a Direct Air Capture climate-tech company, unifying brand storytelling with real transactions.
- Unified four independent third-party services (Shopify Storefront API, HubSpot CRM, SendGrid, Google Analytics) into one coherent experience, keeping the site SEO-friendly and fast despite heavy Framer Motion animation and rich imagery; deployed on DigitalOcean with PM2.

Inventory-ledger - Open-Source Offline-First Sync Engine github.com/GrimmHush/inventory-ledger

TypeScript · Express · Vitest · GitHub Actions

- Built an offline-first inventory sync engine as runnable, reviewable proof-of-competence: two-device offline reconciliation with explicit conflict-outcome handling, exercised by a demo that drives the real HTTP API end to end.
- Green CI pipeline covering typecheck, lint, 59 passing tests, and build, with deliberate handoff documentation.

Additional client sites (React): Namaa Fruits, tropical-fruit export enquiry site (namaafruits.com); Sahara Winds air and sea freight and logistics site (saharawinds.ke); Iano's own studio site (iano.marketing).

EDUCATION

Bachelor of Business Information Technology Strathmore University, Nairobi Apr 2023 - Aug 2026 (expected)

Diploma in Business Information Technology Strathmore University, Nairobi Sep 2020 - Dec 2022

Articulated into the BBIT degree.

Foundation in Engineering International Islamic University, Malaysia Feb 2018 - Feb 2019

Relevant coursework: Web Application Development, Advanced OOP, Data Structures and Algorithms, Advanced Database Systems, Mobile Application Development, Software Engineering, Cloud Computing, Cryptography and Network Security.

References available on request, including the CEO/CTO at CodexSafari.
